

SPLUNK FOUNDATION

2-Day Instructor-Led Training

FOUNDATION	HANDS-ON	BEGINNER FRIENDLY
------------	----------	-------------------

Target Audience	Prerequisites
Beginners, IT Operations, Application Support, DevOps, Security and Monitoring teams	Basic understanding of IT infrastructure, applications, logs, and Linux/Windows
Delivery Format	Recommended Duration
Instructor-led demonstrations and guided hands-on labs	7-8 hours per day; approximately 40% concepts and demonstrations, 60% labs

Prepared by Vivek Arora

Sr. Technical Trainer & Author

DAY 1

Splunk Fundamentals and Data Onboarding

Module 1: Introduction to Splunk

- What is Splunk?
- Use cases: IT operations, security, observability and business analytics
- Splunk Enterprise vs Splunk Cloud
- Platform architecture: Search Head, Indexer, Forwarder and Deployment Server
- Splunk licensing overview

Module 2: Splunk User Interface

- Navigating Splunk Web and installed applications
- Search & Reporting application
- Search modes: Fast, Smart and Verbose
- Search history, Job Inspector and search controls
- Understanding events, fields and timestamps

Module 3: Data Onboarding Fundamentals

- Splunk data-ingestion workflow
- Understanding index, source, source type and host
- Uploading files; monitoring files and directories; receiving network data
- Introduction to Universal Forwarder
- Data validation and basic troubleshooting

Module 4: Introduction to Search Processing Language (SPL)

- Search structure, terms, Boolean operators, wildcards and exact phrases
- Time-range selection and field-based filtering
- Search pipeline and commands
- Using fields, table, sort, rename, dedup and head
- Transforming vs non-transforming commands

Module 5: Fields and Knowledge Objects

- Default, interesting and discovered fields
- Field extraction using Field Extractor and rex
- Calculated values using eval, case and if
- Introduction to tags, event types and lookups

DAY 1 HANDS-ON LABS

- Navigate the Splunk interface
- Upload and index sample application logs
- Identify host, source and source type
- Perform basic searches using SPL
- Filter and format results
- Extract fields and create calculated fields using eval

DAY 2

Reporting, Dashboards and Basic Administration

Module 6: Statistical Analysis Using SPL

- Using stats, chart and timechart
- Aggregation functions: count, sum, avg, min, max and dc
- Grouping results using by
- Working with time-based data
- Using top, rare and where
- Combining eval with statistical commands

Module 7: Lookups and Data Enrichment

- Purpose of lookup tables
- Creating CSV lookups and lookup definitions
- Automatic and manual lookups
- Using lookup and inputlookup
- Enriching events with external information

Module 8: Reports and Visualisations

- Saving searches as reports
- Creating tables and charts
- Selecting and configuring visualisations
- Scheduling, exporting and sharing reports
- Managing permissions and ownership

Module 9: Dashboards

- Creating dashboards and search-based panels
- Tables, charts and single-value panels
- Dashboard inputs, tokens and time-range controls
- Basic interactivity, panel arrangement and sharing

Module 10: Alerts and Monitoring

- Scheduled and real-time alerts
- Trigger conditions, throttling and alert actions
- Email and webhook overview
- Alert management, troubleshooting and best practices

Module 11: Basic Splunk Administration

- Configuration directory structure
- Introduction to inputs.conf, outputs.conf, props.conf and transforms.conf
- Index and retention concepts
- User roles, capabilities and search permissions
- Monitoring Console overview
- Troubleshooting using _internal logs

PRACTICAL EXERCISES

DAY 2 HANDS-ON LABS

- Analyse application performance and error trends
- Build statistical searches using stats and timechart
- Enrich data using a CSV lookup
- Create and schedule a report
- Build an interactive operational dashboard
- Configure a threshold-based alert
- Troubleshoot a basic data-ingestion issue

CAPSTONE EXERCISE

Participants will onboard a sample application dataset and create:

- Search queries for errors, response times and traffic trends
- Field extractions and calculated fields
- A lookup-enriched report
- An operational dashboard
- A threshold-based alert

LEARNING OUTCOME

By the end of the program, participants will be able to onboard data, perform foundational SPL searches, build reports and dashboards, configure basic alerts, and troubleshoot common ingestion and search issues.
